

OnClose

OnClose picture event

Declaration

```
ENTRY OnClose (BOOL _bClose)
; script actions
END OnClose
```

Parameters

<code>_bClose</code>	Required input-output parameter of BOOL type.
----------------------	---

Description

The picture event is being generated by the picture when user attempts to close it. The picture event handler must set the parameter `_bClose` to a value and this is the reaction to user's action. Before terminating the picture event handler, if the parameter is set to:

- @TRUE - the picture will be closed
- @FALSE - the picture will not be closed

Providing that the picture is closed due to logout of a user, OnClose will not arise.

Example

```
; event handler: Attempt to close picture
```

```
ENTRY OnClose (BOOL _bClose)
```

```
_bClose := @FALSE ; refusing to close
END OnClose
```

A picture a **OnClose** handler defined like this can not be closed.

Note

The event handler can be used e.g. for checking parameters defined by the user. If the handler doesn't change the value of the parameter `_bClose`, the picture will be closed.
