

GetApplDir (KomAPI)

Declaration

```
void (_stdcall *GetApplDir)(char *Dir);
```

Parameters

ProtName	A pointer to a buffer with sufficient size (the maximum path length in Windows is 256 characters)
----------	---

Description

The function returns to the buffer pointed to by the *Dir* parameter the application directory of the current D2000 application without the trailing slash (e.g. *D:\D2000\D2000_APP\Demo*).
Note: if the buffer is not big enough (number of characters in the path of the application directory + terminating zero), there will be overflow and writing outside the allocated buffer.
