

Monitoring changes in configuration (Object Groups)

Object Group - monitoring changes in configuration

The objects of the *Object group* type define the user rights to the objects in configuration. They are assigned to the users and enable to define their roles in the application.

From this reason, it is important to keep the records about the changes in their configuration.

The full monitoring records centrally the changes in configuration of those objects of *Object group* type that are directly used in configuration of at least one user. The monitoring is done by the continuous generating of extended information into the monitoring database by the D2000 Server.
