

System Event Logging (Work with D2000 HI)

System event logging

The D2000 System allows to log and then display some important events that occurred in the system during the specified time period. Logging is performed by writing events into the log database – *logfile.db* file in the directory **LOGFILE**, which is a subdirectory of the application directory.

To browse the log database in the [D2000 HI](#) process

1. Select the **Logging** item from the **Open** menu or click the **Logging** button in the [Main toolbar](#) (or press CTRL+M).
2. It opens the [System logging - settings](#) dialog box, which allows defining the logging parameters.
3. Set the parameters and click the **OK** button.
