

SET WITH

SET WITH action

Function	Changes several values at the same time (always in connection with structures).						
Declaration	SET dstIdent_Rec WITH srcIdent_Rec						
Parameters	<table border="1"><tr><td>dstIdent_Rec</td><td>in</td><td>Values' destination (row identifier or whole structure identifier).</td></tr><tr><td>srcIdent_Rec</td><td>in</td><td>Values' source (row identifier, or whole structure identifier).</td></tr></table>	dstIdent_Rec	in	Values' destination (row identifier or whole structure identifier).	srcIdent_Rec	in	Values' source (row identifier, or whole structure identifier).
dstIdent_Rec	in	Values' destination (row identifier or whole structure identifier).					
srcIdent_Rec	in	Values' source (row identifier, or whole structure identifier).					
Description	<p>The structure types of the parameters <code>dstIdent_Rec</code> and <code>srcIdent_Rec</code> must be always identical (otherwise the action generates the error <code>_ERR_RECORD_NO_COMP</code>). The same applies to their size. Their type may be:</p> <ul style="list-style-type: none">• RECORD,• ALIAS (typed),• An object of the <i>Structured variable</i> type. <p>The action sets the values of items from <code>srcIdent_Rec</code> to the values of items from <code>dstIdent_Rec</code>. If <code>dstIdent_Rec</code> is the reference to a row, then <code>srcIdent_Rec</code> must be the reference to a row, too. Accordingly if <code>dstIdent_Rec</code> is a reference to a whole value, then <code>srcIdent_Rec</code> must be a reference to a whole value, too.</p> <p>Therefore, the combination:</p> <pre>RECORD (SD.RecordDef) _lArr1 SET _lArr1[1] WITH SV.Structure</pre> <p>is not permitted and the script editor reports an error during the compilation.</p> <p>When setting a whole value, the number of rows must be identical. For example:</p> <pre>RECORD (SD.RecordDef) _lArr1 SET _lArr1 WITH SV.Structure</pre> <p>The action SET WITH will generate the error <code>_ERR_RANGE_ERROR</code> (the size of <code>SV.Structure</code> is 10 rows and the size of the local variable <code>_lArr1</code> after the declaration is just 1 row). Correct copying the whole value into the local variable is as follows:</p> <pre>RECORD (SD.RecordDef) _lArr1 REDIM _lArr1[SV.Structure]DIM] SET _lArr1 WITH SV.Structure</pre> <p>When copying values to a local variable of RECORD type, which contains items of Object type, the action sets values of the objects, the individual adjusted items are pointed to. This effect is not always desirable. Therefore it is possible to use the NOALIAS modifier when you declare a local variable of RECORD type as follows:</p> <pre>RECORD NOALIAS (SD.RecordDef) _lArr1</pre> <p>For a local variable declared in this way, the pointing feature for all items of Object type is disabled. Their type is not predefined. A value of any type may be assigned to them. For example:</p> <pre>_lArr1[1]^Object := 1 _lArr1[1]^Object := "Text"</pre> <p>See also:</p> <ul style="list-style-type: none">• Script local variables• Permissible combinations of parameters• SET AS action						

Ex
am
ple

```
RECORD (SD.RecordDef) _lArr1
RECORD (SD.RecordDef) _lArr2

INT _index

REDIM _lArr1[5]
REDIM _lArr2[5]
;... initialization of values to the local variable lArr1

; copying values of the 3rd row from _lArr1 into the 2nd row of _lArr2
SET _lArr2[2] WITH _lArr1[3]
; copying the whole value using a loop
; it assumes the same array sizes
_index := 1
NextRow:
IF _index <= _lArr1\DIM THEN
SET _lArr2[_index] WITH _lArr1[_index]
_index := _index + 1
GOTO NextRow
ENDIF ; The same result may be achieved by using SET WITH action
SET _lArr2 WITH _lArr1
```
