

JAVA as a script language

Java as a script language

A programming language JAVA allows implementing of the functions of applications in D2000 scripts.

Java Java Virtual Machine is built into the [D2000 HI](#) and [D2000 EventHandler](#) processes. It enables writing scripts for both objects of [Event](#) and [Picture](#) type.

The functions ensuring access to the D2000 System enable to read and write the value of objects, to respond to the changes of values, read data from databases and archives, to call remote procedures into other ESL/JAVA scripts, to call external functions, etc.
