

IsValidTimeZone

%IsValidTimeZone function

Function

The function checks whether the given text represents a valid time zone.

Declaration

```
BOOL %IsValidTimeZone(  
    TEXT in timeZone  
)
```

Parameters

timeZone	Time zone name.
----------	-----------------

Description

The function checks whether the given text is a valid time zone name or a valid definition of UTC offset.

Valid names are those defined in [Time Zone Database](#). A compendious list is available on [Wikipedia](#).

Valid definition of UTC offset is text using format " $(+/-)hh[mi]ss$ ", where hh defines the number of hours, mi defines the number of minutes, and ss defines the number of seconds. The sign, as well as the number of hours, are essential parts of offset definition, number of minutes and seconds are optional and default to 0 (e.g. "+02:30" defines offset of 2 hours and 30 minutes from UTC).
