

D2000 XML

D2000 XML is the tool intended for online configuration of the objects in D2000 System. It uses the XML standard to keep the object configuration or its parts in the form of [XML files](#).

Use of **D2000 XML**:

- [XML Export](#) and [XML Import](#) - export and import of the object configuration
- [XML Update](#) - update of some part of the object configuration en mass according to filter conditions
- [XML Repository](#) - a global system intended for the creation of object versions
- [XML - CSV conversions](#) (XML files convert into CSV files and vice-versa)
- [export and import of D2000 tables](#)

Note: The name D2000 XML file is replaced by the name XML file in the next chapters of D2000 Online Reference.
