

Licensing the D2000 Products

D2000 software product is license protected. This document will provide you with sufficient knowledge about the D2000 system licensing and what to do when you experience any problems.

Its functionality depends on the presence of either [Hardware](#) or [software key](#) together with a [license file](#) that form a valid [license](#).

If your work station does not contain the proper tools for licensing the **D2000 System**, the server is automatically started as [DEMO](#) mode. It is intended for the testing or trying the **D2000** product.

Ipesoft tries to meet the wishes and requirements of its customers maximally. There is an effort to limit the functionality of the System minimally and to apply the tolerant attitude. The functionality of System, which is not included in the particular end-user license agreement, will not be limited, however, the users will be informed about it regularly (see the chapter [Breach of license agreement](#)).
