

COPYCOLIDX

COPYCOLIDX action

Function

The action copies values between two columns of two local structures.

Declaration

```
COPYCOLIDX _src, _srcColIdx, _dst, _dstColIdx
```

Parameters

_src	in	Local structure identifier determining a source structure used when copying.
_srcCo lIdx	in	Identifier of <i>Int</i> type.
_dst	o ut	Local structure identifier determining a target structure when copying - Record, type ALIAS, object Structured variable.
_dstCo lIdx	in	Identifier of <i>Int</i> type.

Description

The action (analogous to [COPYCOL](#)) copies the column of the structure *_src* which is given by the sequential number *_srcColIdx* into the column of the local structure *_dst* which is given by the sequential number *_dstColIdx*. If the structure *_dst* do not contain required number of rows, the action internally executes the command [REDIM](#).

Example:

```
RECORD (SD.RecordDef) _src
RECORD (SD.DbStruct) _dst

REDIM _src[10]

...
; Copying values from the column src^Int into the column dst^Int
; The action internally executes the action REDIM _dst[_src\DIM]

COPYCOLIDX _src, 2, _dst, 2
```
