

CNT_FIND

CNT_FIND action

Declaration

```
CNT_FIND _hContainer, _key, _value, bFound
```

Parameters

_hContainer	in	Identifier of <i>Int</i> type - data container.
_key	in	Identifier of value in the container.
_value	output	Value in container, if the value of the parameter <i>_bFound</i> is @TRUE, otherwise the value of the parameter remains unchanged.
_bFound	output	@TRUE - value exists in the container. @FALSE - value doesn't exist in the container.

Description

The action finds the value specified by the parameter *_key* in the [data container](#) and inserts it into the *_value* parameter.

If the container doesn't contain a value with specified key, the *_bFound* parameter gets the value of @FALSE and the value of the parameter *_value* remains unchanged.

If the container contains a value with specified key, *_bFound* gets the value of @TRUE and the required value is returned in the parameter *_value*.

As container may contain various types of values, the parameter *_value* must be of proper type, otherwise execution of the script is to be stopped.

Example

[Work with data container \(actions CNT_...\)](#).
