

# JSON\_ObjectToString

## %JSON\_ObjectToString function

Function	Gets a text representation of the JSON object.				
Declaration	<pre>TEXT %JSON_ObjectToString(     INT in handle,     BOOL in pretty )</pre>				
Parameters	<table><tr><td>handle</td><td>Handle to JSON object.</td></tr><tr><td>pretty</td><td>Multi-line formatting of output</td></tr></table>	handle	Handle to JSON object.	pretty	Multi-line formatting of output
handle	Handle to JSON object.				
pretty	Multi-line formatting of output				
Return value	None				
Description	Function gets a text representation of the JSON object.  Exception is thrown if handle to the JSON object is invalid.				
Example	<pre>INT _obj _obj := %JSON_CreateObject()  %JSON_ObjectSetValue(_obj, "Name", "John Smith")  TEXT _txt _txt := %JSON_ObjectToString(_obj)  %JSON_FreeObjectHandle(_obj)</pre>
