Levels in graph
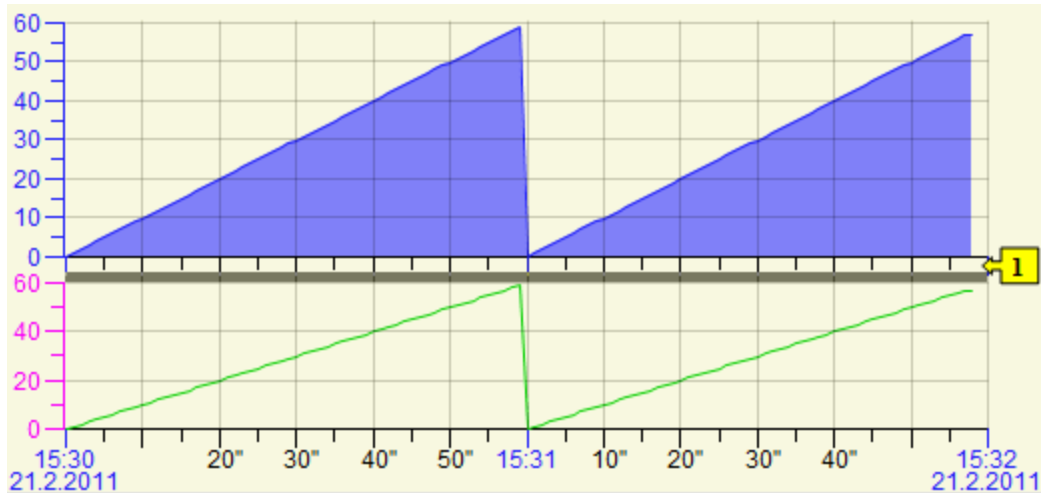

The graph flows may be split into the levels - axis levels or object levels (see object configuration).

The level height may be adjusted as follows:

1. Switch off a control button **Pointer** ⊥.
2. Move the cursor on the place between the levels - a split bar appears (**1**).
3. Click the left mouse button and move the split bar.
4. Release the left mouse button.

Notes

1. The level split according to axis: both a proportional division in the graph and a change of the number of levels (when some of the flows is switch off) are kept.
2. The level split according to objects: the visible flows are evenly split when the number of levels was changed.
