

Instantaneous values

A reference to the instantaneous value of object from D2000 System works through [DDE reference](#) in Microsoft Excel. DDE reference is an expression consisting of object name and type of information. A structure of DDE reference to get the instantaneous value is following:

= D_2000|info!meno_objektu

D_2000	- name of DDE Server – required.
info	- type of information. Acceptable information: • VALUE – current value • TIME – create time of value • STATUS – object status • FLAGS - flag of object value
object_name	- name of object in D2000 System. If <i>Object_name</i> already exists in system, the expression acquires the value of required attribute. If it does not exist in system, the expression acquires the value "Non existing object".
