

# Archive values (Access to the values of D2000 System objects)

The access to the values in archive is complicated owing to the existing rules for getting the values by [DDE reference](#). Each open workbook in Microsoft Excel contains a logic name (**WB\_ID**). This name must be unique within all the open workbooks.

Each action with the archive value or group of archive values of archive object is executed with the help of so-called archive block.

These types of action you can execute with the archive block:

- [requirement for archive value](#)
- [requirement for the status of archive block](#)
- [requirement for resulting value of archive function](#)
- [requirement for number of values in archive block](#)
