

LNG_Translate

%LNG_Translate function

Function

Function translates the text using [dictionary](#) in relation to the [Language Identifier](#).

Declaration

```
TEXT %LNG_Translate(  
    TEXT in str[,  
    INT in lngIdx = -1 | TEXT in lngName]  
)
```

Parameters

str	Text for translation.
lngIdx	Language Identifier . The current language will be used if the identifier is not set or its value is -1.
lngName	Text identifier of language - name of language.

Example

```
TEXT _txt  
INT _lngIdx  
_lngIdx := 1      ; language index can be acquired by HI_LNG_GetCurrLngIdx  
in ESL active scheme script  
  
_txt := %LNG_Translate("Text in brackets is substituted by the  
translation from vocabulary: {!Key}. Language is identified by its name.",  
"SK")
```

Description

A current language is set by a registered user in context of [D2000 HI](#) process.
In context of [D2000 Event Handler](#) process the language is set by called script in RPC procedure execution. In other case the language is undefined.
