

GetLogData

Function

The function **GetLogData** is used to get a data from the log database.

Declaration

```
BOOL GetLogData( GetLogDataRqPtr rqPtr, USHORT wait,
  LogDataPtr dataPtr )
```

Parameters

The parameter *rqPtr* defines a request for a data - there must be defined a time interval, object identifier and required log groups. The parameter *wait* defines a maximal request waiting time. The function may not return all the data from required interval, calling must be repeated with corrected time interval according to received data until required interval is exhausted.

Return value

TRUE - data have been obtained correctly from log database in the time limit. Required data are returned by the parameter *dataPtr*.
FALSE - data have not been obtained.
