# GetStTextStep

## %GetStTextStep function

**Function**

The function gets back a value of configuration parameter "Step" to the object of Status text type.

**Declaration**

```
REAL %GetStTextStep(
   HBJ in  _h
 )
```

**Parameters**

| | |
|---|---|
| **_h** | Value of the HBJ or INT type. |

**Description**

Parameter **_h** represents a unique identifier of the object of Status text type. You can get it as attribute \HBJ.
If the parameter **_h** represents invalid value or refers to the object of incorrect type or the object with specific unique identifier does not exist, the function generates an interruption of ESL script executing with error ERR_EXPRESSION_STATUS.

**Example**

```
REAL _base
REAL _step
INT _range

; ST_TEXT_OBJ - object of Status text type
_base := %GetStTextBase(ST_TEXT_OBJ\HBJ)
_step :=  %GetStTextStep(ST_TEXT_OBJ\HBJ)
_range :=  %GetStTextRange(ST_TEXT_OBJ\HBJ)
```
