

Expressions in Script

Expressions in script

Some actions define values of their parameters by means of expressions. They are [mathematical expressions](#), which gain their values by own evaluation.

All expressions used in an [ESL](#) language script are evaluated by the standard method, that is common e.g. for objects of [Eval tag](#) type, too.

Expressions used in a script are extended with a [set of functions](#) which are not available for objects of [Eval tag](#) type.
