Ext KOM

Communication line of "Ext KOM" category

In the past, the *Ext KOM* line served to run external KOM processes that implemented OEM protocols (on OS/2 platform).

In D2000 v 4, the D2000 KomAPI was developed to support the implementation of external OEM protocols, enabling to use the built-in functionality of the D2000 KOM process using Call-back functions.

At this time, it is still possible to configure the *Ext KOM* category line and stations with protocols OEM1 to OEM16 on this line. The values of configuration p arameters *Path/Directory/Parameters* are available for OEM protocol implementation within the LinePar structure and the OEM protocol can use them. How ever, the KOM process itself no longer uses these parameters and does not run any external process based on them.
