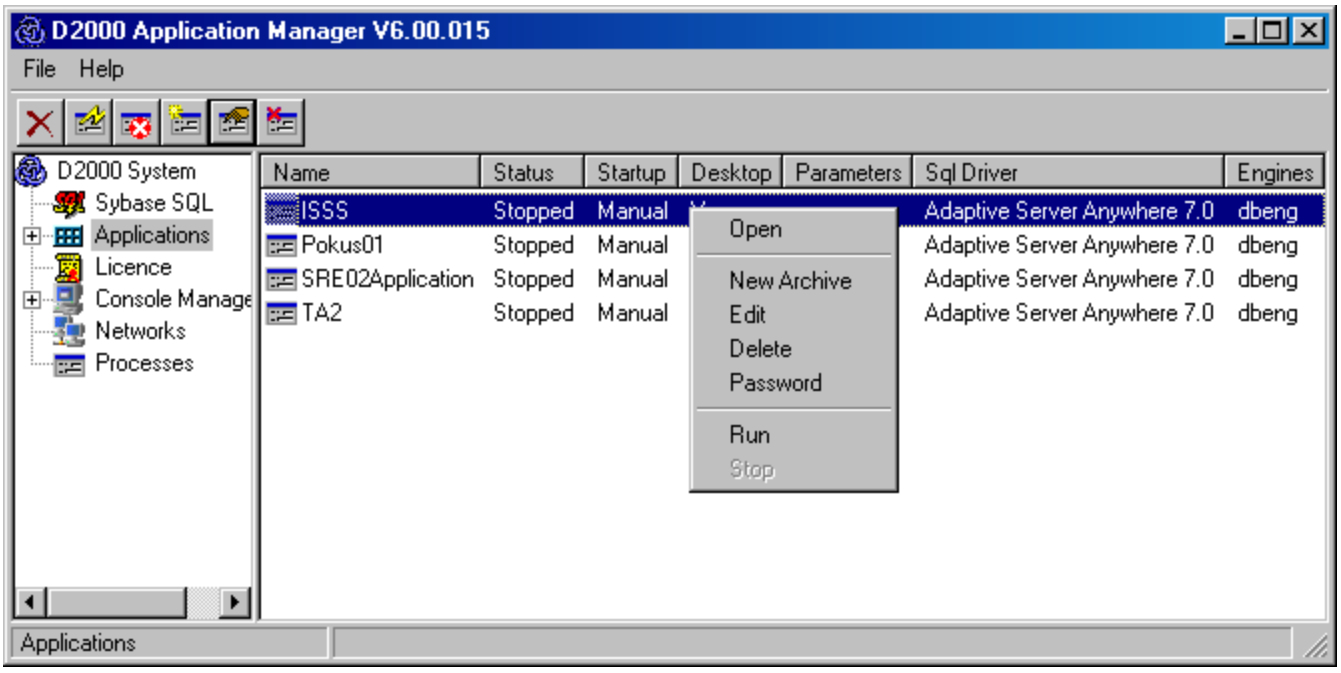
Management of D2000 Applications

D2000 system applications are managed by the tool D2000 Application Manager (*d2smc.exe*).

By application management of the D2000 System we mean:

- Creating a new application
- Editing the selected application
- Starting the application
- Stopping the application
- Cancelling the application
- Creating a new archive
- Editing an existing archive
- Setting parameters for the D2000 Server process
- Setting parameters for the archive



When you select **Applications**, a list of applications configured on this computer will appear in the right part of the window. The meaning of the individual columns of the list is as follows:

Name	Name of the application
Status	Status of the application (*Stopped, Running, Pending*...)
Startup	Method how to start the application service
Desktop	If Yes, process D2Start and D2000 Server will be visible on the desktop
Parameters	List of parameters that are given further at process start D2000 Server
Sql Driver	Driver for database operation
Engines	List of servers that are necessary for the application to run and whose functionality will be monitored by the D2Start process

Note: The application launcher is the D2Start process, which overwatches the D2000 Server and Database Servers process. If D2Start detects that the D2000 Server process stops abnormally, it will try to restart it.
