PointsApply

Declaration

```
void (_stdcall * PointsApply)(HOBJ StID, void * AplPar);
```

Parameters

StID	Station ID. A series of function PointsApplyBack calls will be generated for all I/O tags of the station.
Adr	I/O tag address (Adr1).
AplPar	Pointer that is transmitted to the calling of the function PointsApplyBack.

Description

After calling the function **PointsApply**, the process D2000 KOM calls the interface function PointsApplyBack for all I/O tags of defined station with called ID and gives the parameter *AplPar*. The function mostly eliminates a necessity to keep own lists of I/O tags.
