

# Metadata

Application data (metadata) can be assigned to each graphic object and to column of Browser displayer in the System D2000 application. This metadata are used as storage room for data. The records are stored in key/value format whereby key and value are in the form of text. Value assigned to key can be gained by calling the function `%HI_GetMetadata` and `%HI_GetColumnMetadata`. If the object contains some metadata, the name of the first record will be displayed in the button. Multiple records are indicated by ",...".

Metadata can be set in **Connect object** palette, **Script** tab.

Configuration of metadata:

Button	Action
Add	Adds a new record.
Delete	Deletes marked record.
OK	Saves the changes.
Cancel	Cancel the changes.

The key name can be changed by double click on key in the left part of dialog box. Record value can be changed by choosing the key in left part of dialog box and setting the required value in right part of dialog box.
