

HI_SetTextColor

%HI_GetTextColor, %HI_SetTextColor functions

Function

The function **%HI_SetTextColor** sets the text color of the graphic object ([Control function](#)).

The function **%HI_GetTextColor** detects the text color of the graphic object.

Declaration

```
%HI_SetTextColor(  
    INT in refId,  
    INT in color  
)  
  
INT %HI_GetTextColor(  
    INT in refId  
)
```

Parameters

| | |
|--------------|---|
| refId | Reference to graphic object (reference variable). |
| color | RGB index of color. |

Note

The functions use a color, that is expressed by RGB index. RGB index is a integer number, that express the color representation of the color components - red (R), green (G) and blue (B) in the result color.

The function [%MakeRGB](#) allows to create the color from individual color components.
