Controlling Active Alarms (HI)

Controlling active alarms

Controlling, i.e. acknowledging and blocking active (critical and uncritical) alarms is performed in the Alarm list window, or by means of the control window of the object with defined process alarms.

The Alarm list window can be opened by one of the following ways:

- on alarm occurrence in the system (if the feature is enabled - see the parameter groups Critical alarms and Uncritical alarms in the **Console preferences** (or **User preferences**) dialog box - the **Open dialog on alarm** option),
- clicking the bulb icon located in the bottom left-hand corner of the D2000 HI's desktop,
- clicking the button in the Main toolbar,
- selecting the item **Alarms** from the menu **Open**,
- clicking the shortcut Ctrl+A.

Process alarms can be controlled by means of the control window of an object with defined process alarm.
