D2000 CfgSynchro

D2000 CfgSynchro - is a standalone program that is used to copy objects between two configuration databases. By means of user interface it is possible to identify changed objects and subsequently synchronize the databases. It is particularly appropriate for synchronization of databases, which were created as a copy of original configuration database but some changes have been performed in them separately.
The **D2000 CfgSynchro** utility comes in two basic versions (according to the database access).

- The first version (*cfgsynchro.exe*) accesses to database via standard ODBC interface (Sybase, MSDE a Oracle).
- The other version (*cfgsynchro_ora.exe*) is designated for Oracle databases and uses its native OCI interface to access the database.
