

XML instruction

Specification of XML instruction complies with [XML file structure](#) and

- **must contain** <CFGRECORDS> reserved section containing the changed attributes
- **must not contain** another reserved section than <CFGRECORDS>

Characteristics of <CFGRECORDS> section

- <Name> attribute has a special function, it is the file name for [XML filter](#)
- other attributes are the attributes of changed objects which are to be modified en masse
- the structure must not contain the attributes with string [values](#) of SDT_EXPRESSION or SDT_RAW_DATA type

Example of XML file representing the XML instruction

```
<?xml version="1.0" encoding="utf-8"?>
<ROOT>
  <CFGRECORDS>
    <TObjItemData>
      <Name>filter.xml</Name>
      <Descript>New Descript</Descript>
    </TObjItemData>
    <TArchivData_Full>
      <TArchivData>
        <Periode>20</Periode>
      </TArchivData>
    </TArchivData_Full>
  </CFGRECORDS>
</ROOT>
```

A location of directory containing the filters (because the instruction contains only its name) will be set at [XML Update](#).
