

# SetDefaultRegValue

## %SetDefaultRegValue function

### Function

The function writes the default value of the specified key into the Windows system registry.

### Declaration

```
BOOL %SetDefaultRegValue(
    TEXT in keyNameStr,
    TEXT in Value
)
```

### Parameters

keyNameStr	Key name in the Registry.
Value	Value to write.

### Return value

@TRUE on success.

### Note

The function will write a default value of the key to the registry. The name of written key is *keyNameStr*. If the key does not exist, the function creates it.

The type of default value in registry is String, therefore only *Text* type of **Value** parameter is supported.

### Example

In the following example, the default value of the key HKEY\_LOCAL\_MACHINE\SOFTWARE\Ipesoft is written into the registry:

```
BOOL _bOk
_bOk := %SetDefaultRegValue( "HKEY_LOCAL_MACHINE\SOFTWARE\Ipesoft", "test" )
```
