

Impt

%Impt function

Old name	%ImptI				
Function	The function returns the accession of the given integer variable. The result is an integer number.				
Declaration	<pre>INT %Impt(INT in Arg, TIME in ResetTime)</pre>				
Parameters	<table><tr><td>Arg</td><td>Variable which accession is calculated. The function assumes, that the value of the variable Arg is increasing within the calculation interval. (For example: electrometer status).</td></tr><tr><td>ResetTime</td><td>Calculation reset time.</td></tr></table>	Arg	Variable which accession is calculated. The function assumes, that the value of the variable Arg is increasing within the calculation interval. (For example: electrometer status).	ResetTime	Calculation reset time.
Arg	Variable which accession is calculated. The function assumes, that the value of the variable Arg is increasing within the calculation interval. (For example: electrometer status).				
ResetTime	Calculation reset time.
