

Imp

%Imp function

Old name	%Impl				
Function	The function returns the accession of given integer value. The result is an integer value.				
Declaration	INT %Imp(INT in Arg, BOOL in ResetTrigger)				
Parameters	<table><tr><td>Arg</td><td>Variable which accession is calculated. The function assumes, that the value of the variable Arg is increasing within the calculation interval. (For example: electrometer status).</td></tr><tr><td>ResetTrigger</td><td>Change of the parameter into the TRUE state resets the calculation.</td></tr></table>	Arg	Variable which accession is calculated. The function assumes, that the value of the variable Arg is increasing within the calculation interval. (For example: electrometer status).	ResetTrigger	Change of the parameter into the TRUE state resets the calculation.
Arg	Variable which accession is calculated. The function assumes, that the value of the variable Arg is increasing within the calculation interval. (For example: electrometer status).				
ResetTrigger	Change of the parameter into the TRUE state resets the calculation.
