

MaxImp

%MaxImp function

Old name	%MaxImpI				
Function	The function returns the accession of the given integer variable for the time period elapsed. The result is an integer value.				
Declaration	<pre>INT %MaxImp(INT in Arg, BOOL in ResetTrigger)</pre>				
Parameters	<table><tr><td>Arg</td><td>Variable which accession is to be calculated. The function assumes, that value of the variable <i>Arg</i> increases within the calculation interval. (For example: electrometer status).</td></tr><tr><td>ResetTrigger</td><td>Change of the parameter into the TRUE state causes resetting the calculation.</td></tr></table>	Arg	Variable which accession is to be calculated. The function assumes, that value of the variable <i>Arg</i> increases within the calculation interval. (For example: electrometer status).	ResetTrigger	Change of the parameter into the TRUE state causes resetting the calculation.
Arg	Variable which accession is to be calculated. The function assumes, that value of the variable <i>Arg</i> increases within the calculation interval. (For example: electrometer status).				
ResetTrigger	Change of the parameter into the TRUE state causes resetting the calculation.
