IsNull

%IsNull function

Function

If the first parameter *Arg* is valid (i.e. the value of attribute VLD of parameter *Arg* is TRUE), the function returns the parameter *Arg*. If the first parameter *Arg* is invalid, the function returns the second parameter *Replacement*.

Declaration

```
UNIVAL %IsNull(
   UNIVAL in Arg
   UNIVAL in Replacement
 )
```

Parameters

Arg	Compared value.
Replacement	Replacement value if *Arg* is invalid.

Example

```
 INT _i, _j, _k

 _i  := %IsNull ( Sec, Min)         ; returns value of Sec, as it is
always valid

 _i  := %SetInvalid(_i)              ; invalidate the value
 _j  := 999
 _k  := %IsNull ( _i, _j)           ; returns value 999, as the value of
_i is invalid
```
