

SetRegValue

%SetRegValue function

Function

The function writes given value into the Windows system registry.

Declaration

```
BOOL %SetRegValue(  
    TEXT in keyNameStr,  
    in Value  
)
```

Parameters

keyNameStr	Key name in the Registry.
Value	Value to write.

Return value

@TRUE on success.

Note

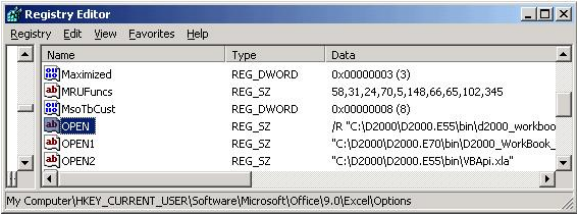

The function will write the given value into the registry. The name of the written key is *keyNameStr*. If the key does not exist, the function generates it.

The following types of values to write are supported:

- *Bool*
- *Text*
- *Integer*

Example

In the following example, the writing the value HKEY_CURRENT_USER\Software\Microsoft\Office\9.0\Excel\Options\OPEN into the registry is performed:

```
BOOL _bok  
_bok := %SetRegValue("HKEY_CURRENT_USER\Software\Microsoft\Office\9.  
0\Excel\Options\OPEN", "hodnota")
```
