

GetComputerName

%GetComputerName function

Function

The function retrieves the name of the computer, where the calling ESL is interpreted.

Declaration

```
TEXT %GetComputerName([BOOL in bPhysicalComputerName := @TRUE])
```

Parameters

bPhysicalComputerName

Optional parameter that is important providing that the process (usually D2000 HI) is started up within RDP or Citrix session.

@TRUE - function returns the name of the computer, on which the process runs (server name).

@FALSE - function returns the name of the computer, from which RDP or Citrix session is started up (client name).
