

# Bpr

## %Bpr function

|                   |   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
|-------------------|---|-----------|-----------------|-----------|--------------|-----------------|------------|-------------------|-------------|-----------|-----------------|-----------|-----------------|
| Old name          | %BprB   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| Function          | The function implements a two-position controller. The result is a value of Boolean type.   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| Declaration       | <pre>BOOL %Bpr(     REAL in RV,     REAL in IV,     REAL in DeadBand,     REAL in Hysteresis,     BOOL in OO/CO )</pre>   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| Parameters        | <table border="1"> <tr> <td><b>RV</b></td><td>Required value.</td></tr> <tr> <td><b>IV</b></td><td>Input value.</td></tr> <tr> <td><b>DeadBand</b></td><td>Dead band.</td></tr> <tr> <td><b>Hysteresis</b></td><td>Hysteresis.</td></tr> <tr> <td><b>OO</b></td><td>Opening output.</td></tr> <tr> <td><b>CO</b></td><td>Closing output.</td></tr> </table>   | <b>RV</b> | Required value. | <b>IV</b> | Input value. | <b>DeadBand</b> | Dead band. | <b>Hysteresis</b> | Hysteresis. | <b>OO</b> | Opening output. | <b>CO</b> | Closing output. |
| <b>RV</b>         | Required value.   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| <b>IV</b>         | Input value.  |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| <b>DeadBand</b>   | Dead band.  |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| <b>Hysteresis</b> | Hysteresis.   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| <b>OO</b>         | Opening output.   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| <b>CO</b>         | Closing output.   |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
| Note              | <p>Control is executed according to the left part of the figure (<math>OO/CO = @OO</math>) or according to the right part of the figure (<math>OO/CO = @CO</math>).</p> <p><b>Parameters:</b></p> <ul style="list-style-type: none"> <li>• DeadBand = AC (<math>&gt;0</math>) - real value</li> <li>• Hysteresis = BC (<math>&gt;0</math>) - real value</li> </ul> <p><b>Input variables:</b></p> <ul style="list-style-type: none"> <li>• IV (input value) - real value</li> <li>• RV (required value) - real value (constant or continuous signal)</li> </ul> <p><b>Output variables:</b></p> <ul style="list-style-type: none"> <li>• OO (opening output) - value of Boolean type</li> <li>• CO (closing output) - value of Boolean type</li> </ul> <p><b>Function:</b></p> <ul style="list-style-type: none"> <li>• State1: IV &lt;= RV - AD, then OO=1 and CO=0</li> <li>• State2: RV - AD &lt; IV &lt; RV - AB, then OO is not changing and CO=0</li> <li>• State3: RV - AB &lt;= IV &lt;= RV + AB, then OO=CO=0</li> <li>• State4: RV + AB &lt; IV &lt; RV + AD, then OO=0 and CO is not changing</li> <li>• State5: RV + AD &lt;= IV, then OO=0 and CO=1</li> </ul> |           |                 |           |              |                 |            |                   |             |           |                 |           |                 |
