

%GetRPCCallerIsJava function

Function

Function identifies whether the call of currently processed RPC procedure was initiated from ESL or JAVA script.

Declaration

```
BOOL %GetRPCCallerIsJava()
```

Parameters

No parameters.

Description

Function complements the functions [%GetRPCCallerObject](#) and [%GetRPCCallerProcess](#). It is advisable to use it in reverse RPC call because of the need to distinguish whether the RPC procedure is implemented in ESL or Java script (the script actions CALL and CALLJ).

Example

The usage of function is stated in the example of [%GetRPCCallerObject](#) function.
