## Stepping

## Script debugging - stepping

Debugging of actions is controlled by the local pop-up menu, or by keyboard shortcuts. The pop-up menu is displayed after pressing the right mouse button above the script source text (script editor - part 4).

Go to Definition	Ctrl+F12
Go to References	Shift+F12
Go to Symbol	Ctrl+Shift+O
Peek	>
Editor settings	
Insert/Remove Breakpo	bint
Clear All Breakpoints	
Pause	F4
Continue	F5
Step Over	F7
Step Over + Profiling	Ctrl+F7
Step Into	F8
Go To Line	
Go To End	F6
Debugger Settings	
Evaluate Selection	Shift+F9
Show Instance Info	
Show all instances	
Сору	
Command Palette	F1

Action	Meaning	
Go to Definition	The cursor in the editor moves to the place where the identifier is declared. When using "Go to definition" on a remote procedure (RPC/PUBL IC), the ESL editor automatically opens the script containing the procedure definition and sets the cursor to the definition. If the text under the mouse cursor is a valid object name, we open it for editing.	
Go to Referenc es	A nested editor is displayed with the option to switch between the individual references of the local variable/procedure.	
Go to Symbol	A selection box is displayed with filtering of all symbols (local variables, procedure parameters, procedures), after selecting the symbol and pressing the ENTER key, the cursor moves to the symbol definition.	
Peek	<ul> <li>There are two options here:</li> <li>Peek Definition (ALT + F12) - the nested editor is displayed at the position of the local variable/procedure definition.</li> <li>Peek References - a nested editor is displayed with a reference to a local variable/procedure, with a list of individual references in the right part.</li> </ul>	

Editor Settings	Displays the ESL Editor Settings dialog (font and colors).					
Insert /Remove Breakpoi nt	Inserts a breakpoint (script editor - part 3) for the action given by the cursor position. The script execution will be stopped when it reaches the breakpoint. When the debugging is finished and started again the breakpoints will be activated (only when the row count of the ESL script has not been changed).					
Clear All Breakpoi nts	Clears all breakpoints.					
Pause	Interrupts continuous execution of script actions (e.g. after selecting the option Continue, or Go	To End ).				
Continue	Runs continuous execution of script actions to the nearest breakpoint, end, or an error occurrence (see the parameter Settings).					
Step Over	Stepping without nesting.					
Step Over + Profiling	Performs a step without nesting and dumps the profiling information about this step. After performing this step, the excel file with the contingent table opens. This file contains detailed information about the executed action. The profiling information is processed and displayed through the tool ESL profiler, which needs installed Microsoft Excel for its functionality.					
	Warning: Viewing the profiling information may take a few seconds.					
Step Into	Stepping with nesting.					
Go to Line	Runs continuous execution of script action to the current action, the nearest breakpoint, end, or error occurrence					
Go to End	Runs the continuous execution of script actions to the nearest breakpoint, end, or error occurrence.					
Debugge	Sets the parameters for continuous action execution or stepping.					
r Settings						
Selection	<ul> <li>selected text in the script</li> <li>local variable or structure item at which the cursor is pointing</li> </ul>					
	Compile Debug Notations Watch Evaluate					
	%RxReplaceStr("Hello world!", "Hello", "Hi") 💿 🗸					
	Description Value					
	Value Type Text	_				
	Actual value Hi world!	_				
	Value Time 09/07/2021 15:06:51.021	_				
	Attributes	_				
	Limits INLIMIT	-				
	Process Alarm NoAlarm	-				
	Alarm time Undefined					
Show Instance Info	Shows detailed information about the current instance of ESL script					
Show All Instances	Shows the list of all running instances of the edited ESL script.					
Сору	Copies selected text to clipboard.
