## Remote objects - example

The example describes all the necessary steps to make the values of the user variable U.1 from the application **APPL2** available. So we create an object of Remote tag type (called  $R_{-}U_{-}1$  in the example) in the application **APPL1**. The parent of the object is the process **D2000 GtwCli** (suffix of it is .GTW).

Seeing that the value type of the object *U.1 Int*, so the type of the remote tag *R.U.1* must also be *Int - Integer*.

Controlling the remote tag is set to Manual, therefore user can set the value of the remote tag as well as the value of the object in the application APPL2.
