

Start Up Event

A Start Up Event is an object of the [Event](#) type, that is started automatically after a successful start of the [D2000 Event Handler](#) process. It may be used for various initializations.

When configuring a Start up event you select the start object, that is the parent of the event (the process [D2000 Event Handler](#), where the event is interpreted on). If more events are configured in this way, all the events will be started.

Object status (trigger) for the event start is not important in this case, it may be set to *Change*.
