

XML_Add_NS_Definition

%XML_Add_NS_Definition function

Function

The function inserts the definition of namespace to an element of an XML document.

Declaration

```
TEXT %XML_Add_NS_Definition(  
    INT in node,  
    TEXT in namespaceURI,  
    TEXT in namespacePrefix  
)
```

Parameters

node	Handle to an XML element in which a namespace is to be defined.
namespaceURI	Name of namespace.
namespacePrefix	Name of prefix.

Return value

Description

The function inserts the definition of a namespace to the element of an XML document. The definition consists of a unique name of a namespace (URI) and its prefix. In fact, it is just inserting the attribute of an XML element according to this convention:

```
<element xmlns:h="http://xxx">
```

where "h" is the prefix name of namespace and "http://xxx" is name of namespace, i.e. URI.

Example

```
BOOL _bAdded  
_bAdded := %XML_Add_NS_Definition(%XML_Item(_iElement,0),"http://localhost","h")
```
