

XML_GetElement_NS_Prefix

%XML_GetElement_NS_Prefix function

Function

The function returns a text string that represents the namespace prefix of an XML element.

Declaration

```
TEXT %XML_GetElement_NS_Prefix(  
    INT in_node  
)
```

Parameters

node	Handle to XML element.
-------------	------------------------

Return value

Description

The function returns a text string that represents the namespace prefix of an XML element. If the function returns an invalid result, you may find out the information about error by calling the function [%XML_GetLastErrorMessage](#).

Example

```
TEXT _namespace_prefix  
TEXT _errorCodeText  
  
_namespace_prefix := %XML_GetElement_NS_Prefix(%XML_Item(_iElement,0))  
IF (!_namespace_prefix\VLD) THEN  
    _errorCodeText := %XML_GetLastErrorMessage()  
ENDIF
```
