

# Examples

## Reports - examples

Using the interface [D2000 VBApi](#), the report implementation in the MS Excel environment is a quite complex activity. Therefore, there are implemented the following tools, which can be either an "inspiration" or they can be directly used for creating reports.

- [LiveView](#) - a simple tool for viewing current values of D2000 system objects
- **ArchView** - a tool for viewing historical values (not use, nowadays)
