

D2_CalcStatFunc

Accessing historical values - D2_CalcStatFunc function

The function allows you to calculate the specified statistical archive function on demand.

Declaration

D2_CalcStatFunc

```
(archIdent, bt, et, statFuncID, validPerc, paramIdent, refresh)
```

Parameters

archIdent	TEXT type	<ul style="list-style-type: none">Reference to one value of historical value.Reference to simple value of object (not structured variable).In case of structured variable it is one item (SV.Struct[2]^Item), otherwise name of object (e.g. I/O tag). In this case the system will automatically look for a "suitable" object of Historical value type. If the column "Item" is of the Object type it is possible to specify a string ",ALL" right after the name of column (e.g. SV.Struct[4]^Item,ALL). This causes the historical values to be obtained for the connected object, not for the item of a structured variable.
bt	ABS. TIME type	Interval begin time.
et	ABS. TIME type	Interval end time.
statFuncID	INT type	Statistical function type. The type is represented by a numerical value (see the table).
validPerc	INT type	Validation criteria.
paramIdent	REAL or INT types	Parameter for some types of functions.
refresh		Optional parameter of optional type.

Description

The function calculates the statistical function specified by the parameter *statFuncID* on the values represented by the historical value *archIdent* within the time interval given by the parameters *bt* and *et*. After successful execution, the function returns a result value.

The parameter *validPercIdent_Int* represents [Validation criteria](#) used during evaluation of the statistical function. It can get the values within 0 .. 100 (the error ERR_RANGE_ERROR occurs if the condition is broken).

For some statistical function, it is required to enter the parameter *paramIdent* according to the table:

Statistical function	Parameter description								
_STAT_F_INTEGRAL	<p>Integral time units. For individual types, there are also established predefined local variables according to the table:</p> <table><tr><th>Constant</th><th>Description</th></tr><tr><td>_INTEGRAL_HOURUNIT</td><td>Hour integral</td></tr><tr><td>_INTEGRAL_MINUNIT</td><td>Minute integral</td></tr><tr><td>_INTEGRAL_SECUNIT</td><td>Second integral</td></tr></table>	Constant	Description	_INTEGRAL_HOURUNIT	Hour integral	_INTEGRAL_MINUNIT	Minute integral	_INTEGRAL_SECUNIT	Second integral
Constant	Description								
_INTEGRAL_HOURUNIT	Hour integral								
_INTEGRAL_MINUNIT	Minute integral								
_INTEGRAL_SECUNIT	Second integral
