

Debugging Functions

Debugging functions

To open the debug console:

Declaration

D2_OpenDbgConsole

```
( bOpen )
```

Parameters

bOpen	typ BOOL	TRUE - open the debug console. FALSE - close the debug console.
-------	-----------------	--

Description

If the value of the parameter is TRUE, the function will open the text window where are displayed the following debug information:

- communication with the [D2000 Server](#)
- internal debug logs
- debug logs written by the function **D2_WriteToConsole**

If the value of the parameter is FALSE the text window will be closed. Closing the text window will close the MS Excel application !!!

Return value

Return value of the function is always TRUE.

To write a text into the debug console:

Declaration

D2_WriteToConsole

```
( dbgText )
```

Parameters

dbgText	typ TEXT	Text to write in the debug console.
---------	-----------------	-------------------------------------

Description

The function writes the text defined by the parameter *dbgText* into the debug console. If needed, it opens the debug console (internal call of the function **D2_OpenDbgConsole**).
