

# Defining of archive block

When defining (registration) the archive block, you need the following data:

- **BT** – begin time of interval
- **ET** – end time of interval
- **arch\_obj** – name of archive object
- **blname** – name of archive block (e.g. WB1\_Blok2)
- **step** – required time step between the values from archive

A sheet in workbook - DECLARATION, is intended for defining (registering) of archive blocks. This sheet is password locked so that you cannot edit some cells. DECLARATION contains a predefined blank table that allows you to define the parameters for the function **RegisterArchBlock**. The table contains one blank column for definition of parameters and other archive blocks. You can execute other auxiliary calculations. The cell **\$B\$1** contains a logical name of workbook. It can be changed through the item **Change name** in **D2000** menu.
