

GetTriggerQueueLen

%GetTriggerQueueLen function

Function

The function returns the number of requests for starting the [event instance](#) or executing the RPC procedure.

Declaration

```
INT %GetTriggerQueueLen( )
```

Description

The use of this function depends on the object which includes the ESL script.

If the ESL script is placed in the object of the *Event* type that is started to the change of object value, the function returns the number of requests to start an event, if the request queue to start the [event](#) is enabled, or -1, if the queue is disabled.

If the ESL script is placed in the object of the *Event* type whose parameter **ServerEvent** is enabled, or in the object of the *Picture* type, the function returns the number of pending requests to execute RPC procedures.
