

GetObjTechUnit

%GetObjTechUnit function

Function

The function returns the technical units of the object specified by its unique identifier (HOBJ).

Declaration

```
TEXT %GetObjTechUnit(  
    HBJ in objID  
)
```

Parameters

objID	Value of HBJ or INT types.
--------------	------------------------------------------

Description

The function sends a query to the [D2000 Server](#) process to detect the technical units of the D2000 system object defined by the parameter *objID*. If the object doesn't exist or the parameter is an invalid value, the function returns invalid value.

Example

```
INT _hbj  
TEXT _techUnit  
  
; HOBJ of the object U.TestTechUnit  
_hbj := %StrToHBJ("U.TestTechUnit")  
  
_techUnit := %GetObjTechUnit(_hbj) ; variable _techUnit will contain  
the technical units of U.TestTechUnit  
  
; object probably doesn't exist => _techUnit will be invalid value  
_techUnit := %GetObjTechUnit(928374)
```
