

# Expressions in Script

## Expressions in script

Some actions define values of their parameters by means of expressions. They are [mathematical expressions](#), which gain their values by being evaluated.

All expressions used in an [ESL](#) language script are evaluated by the standard method, which is common also for objects of [Eval tag](#) type.

Expressions used in a script are extended with a [set of functions](#) that are not available for objects of [Eval tag](#) type.
