

SET BIND

SET BIND action

Function

Declaration

Parameters

Description

Binding (or unbinding) a row of a local variable of the RECORD type to a row of an object of the *Structure d variable* type.

SET _locRecord_Row BIND structObj_Row

or

SET _locRecord_Row BIND NONE

_locRecord_Row	in	Reference to a row of the <i>Structure</i> (RECORD) type local variable.
structObj_Row	in	Reference to a row of the Structured variable type object.

The structure types of the parameters `_locRecord_Row` and `structObj_Row` must be identical (otherwise the action generates the error `_ERR_RECORD_NO_COMP`).

The action binds the given row of the *RECORD* type local variable to the given row of a *Structured variable* type object. Binding results in that all actions, executed on items (of a local variable) of such a row bound, are executed, in principle, on the particular items of a *Structured variable* type object (reading /setting a row, changing an linked object for items of *Object* type ([SET AS](#) or [SET WITH](#) actions)).

The action **SET _locRecord_Row BIND NONE** will unbind the given rows and all values of the row unbound will get undefined value.
