

Browser displayer (HI)

Browser is a special type of displayer. It allows access and work with structures from pictures opened in process [D2000 HI](#). Browser, as well as pictures, is being configured in the process [D2000 GrEditor](#).

Browser displayer looks like the dialog box described in the previous topic, but there are several important differences:

- Browser window is integrated into corresponding picture and becomes its fixed part,
- work with a structure using a Browser placed in the picture is allowed to each user with the access rights to the structure (structured variable, database table) so not only to HI administrator or to configurator.
- Browser contains a lot of configurable settings that define its functionality, appearance and contents. These settings are described in the *D2000 System configuration* online manual.
